Affect Coding Protocol

Affect is coded on a 10-sec epoch basis, with the most "intense" affect coded during each epoch

Code		**Descriptor**
Numerical code	Affect/behavior	
1	Intense Anger/Rage or Hard Crying/Screaming *Intensity*: loud, prolonged, clear distress	*Intense crying: facial expression with or w/o tears: deep vertical wrinkles between brows, brows drawn sharply down and together, thick lines in forehead, eyes tense and closed, open, angular mouth, no lip corner raise, arched back* *Anger/Rage: Brows down straight or slanting down toward the center. Brows are often drawn together. May be bulges or wrinkled around brows. Cheeks should be raised. Mouth could be straight, angular, or drawn tightly shut.*
2	Frustration or Crying *Moderate intensity*: brief crying or visible frustration	*Sad or angry (crying) facial expression with or w/o tears: eyes squinted or briefly closed, pronounced bulge between brows, mouth tense, corners drawn straight back*
3	Fussing/Negative Affect without vocalizations *Low intensity*: facial expression only, no tears or vocalization	*Negative (fussing / anger / grimace / sad) facial expression without tears: inner corners of brow raised, mild wrinkling between brows, mouth may be open or closed, lips may be pressed or tightened, open mouth is square-ish, no lip corner raise*
4	Neutral	*Facial expression is neither positive nor negative (no attributes of any other code)* *For example:* • *staring at object or person* • *forehead smooth, eyes open, mouth relaxed*
5	Mild enjoyment/positive	*Slight smile: eyes neutral, lip corner slightly raises or cheeks slightly raised*
6	Clear enjoyment/positive	*Smiles: lip corner raise necessary, possibly also have cheek raises and/or jaw drop* *Positive expression: corners of mouth slightly drawn back, round, open mouth, brows slightly raised*
7	Intensely smiling/laughing	*Large smiles - jaw drop, lip corner raise, cheeks raised, eyes crinkled* *Laughs* *Very positive expression: eyes squinted, forehead smooth, lip corners raised*

		Excitement: Brows together but not up or down. Mouth relaxed. Could be vertical furrows or bulging in forehead. Another possibility is upper face neutral, mouth open and relaxed.
8	Mixture positive/negative	*Any mixture of positive and negative attributes where neither dominates in the 10-sec epoch*
9	Unclassifiable	*Shows affect that cannot be categorized into one of the above affect codes*
10	Unobservable	*Unobservable: face is obscured, unable to assess affect Autonomic indicator: infant yawns or sneezes, affect is not codable*
